

NO BUTTS ABOUT IT!

THE STEM CELL LIFT®: BUTTOCK ENHANCEMENT

UTILIZES STEM CELLS & LIPO- BODY SCULPTING

TO ENSURE A SAFE AND SCARLESS PROCEDURE WITH

NATURAL LOOKING RESULTS

(Beverly Hills, CA)- Nathan Newman, MD. who has gained a sterling, international reputation for his groundbreaking Stem Cell Lift,® a scar-free, knife-free face lift that restores a youthful appearance using the patients' own stem cells, is now offering the Stem Cell Lift® for buttock enhancement. This innovative procedure contours, sculpts, fills and lifts the butt. Even dimples and cellulite on the buttocks will be dramatically improved with this procedure as the skin and tissues will become tighter and smoother. The repositioning of the fat into the buttocks is achieved with minimal pain or recovery time.

Here is how it works: Using an artistic lipo-sculpture technique, excess fat from the lower back, hips, flanks (love handles), outer thighs, inner thighs and/or the area immediately below the buttocks (banana folds) is extracted and utilized to create a shapelier and more proportioned frame for the buttocks to enhance its appearance.

The fat is “harvested” with special instruments to keep the fat alive and intact. Next, in Dr. Newman’s proprietary procedure, in less than an hour, the stem cells are separated from the fat cells and concentrated. The super-charged stem cells are added to the fat to significantly increase the number of stem cells. The stem cell-enriched fat is then injected with special instruments in a precise and systematic fashion to contour and augment the buttocks.

.This procedure can be done under local anesthesia. Side effects include some soreness and swelling in the area for a few days, which usually does not require pain medication. There is not much down time with the procedure, as most patients are able to return to work in two to four days and resume their regular exercise routine in about two weeks.

The Stem Cell Butt Lift® is a more comprehensive, safer and most natural way to augment the buttocks. The fat has many advantages in that it is natural and undetectable; it is scarless; it does not move from the area that it has been injected into, and it feels firm but not hard. The stem cells help to maintain the volume that can be achieved with patients' own fat.

When implants are used for buttock enhancement, it requires cutting the skin, which leaves a scar. The buttock implants have many disadvantages including the potential for dislodging from its position, the need to be removed in case of infection, and an uncomfortably hard feel.

A bonus to the process of harvesting stem cells for buttock enhancement is that the patient's stem-cell, enriched fat can also be utilized to sculpt and contour other parts of the body, including hands, breasts and calves as well as for a Stem Cell Lift® face lift.

Dr. Newman has been researching and working with adult stem cell therapy for more than a decade. He is now successfully utilizing his Stem Cell Lift® joint repair, with a 100% success rate in repairing damage to torn meniscus in the kness as well as other other joint problems from age deterioration. Also, recently Dr. Newman has given new hope to patients suffering from the little-known, but debilatating auto-immune condition, Lichen Sclerosus, which attacks both male and female genitals, with the Stem Cell Lift®
